Psychophysics and contact mechanics to study the boundaries of tactile perception

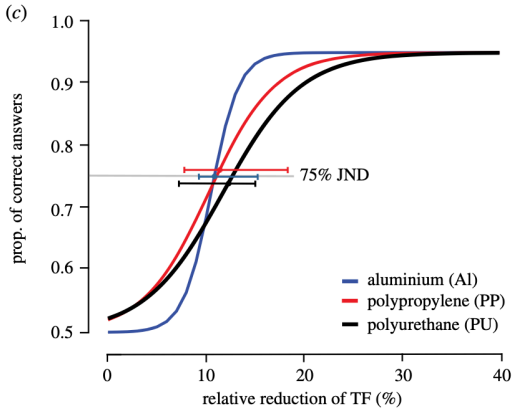
GDR TACT November 2025

Outline

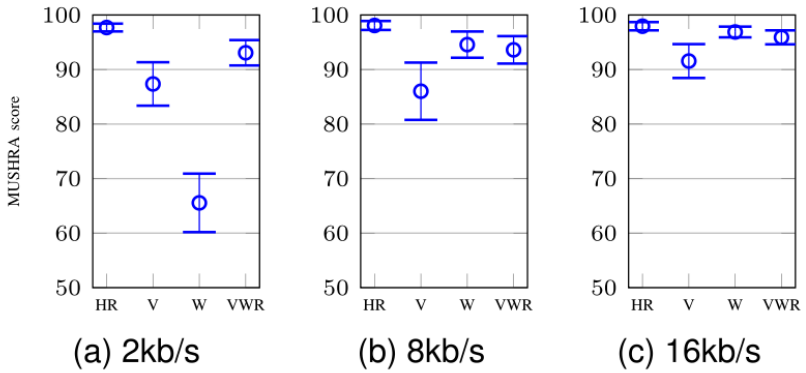
- What psychophysics can do, and what it can't
- Testing the boundaries of tactile acuity
- Expert plucking of guitar strings
- Feeling isoenergetic ultrasonic signals
- When perception is multisensory

From physics to perception

Physics on the skin → **Reported sensation**



Gueorguiev et al.



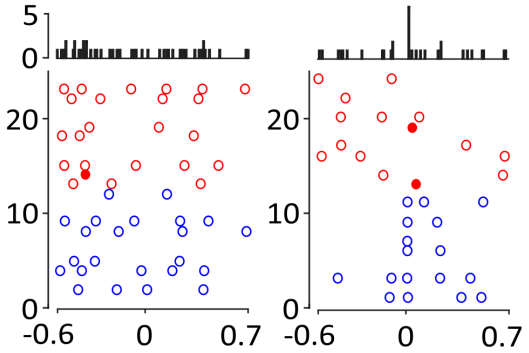
Guillotel et al.

- The perception results are empirical
- Might be enough if you are testing the device rather than the person
- Can hint towards the cognitive mechanisms at play

Adding Neuroscience

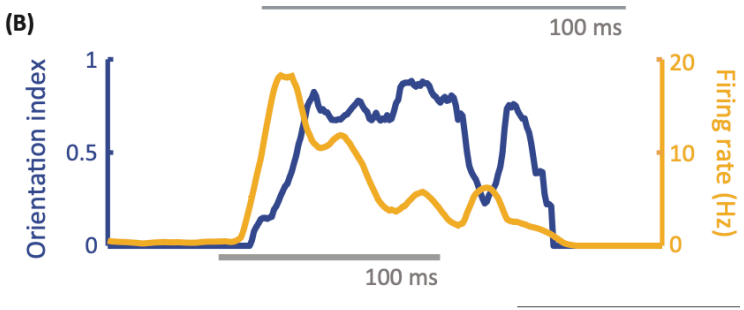
Physics on the skin → **Reported sensation**

Peripheral receptors



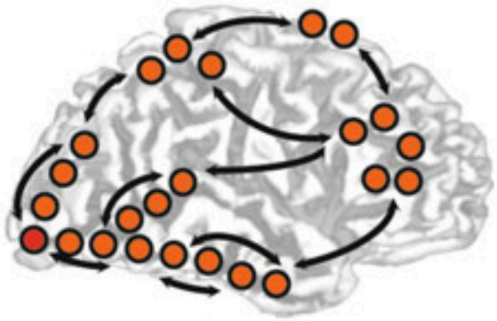
Dione et al.

Somatosensory neurons

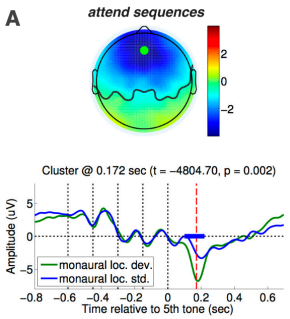


Sall et al.

Metacognitive phenomena

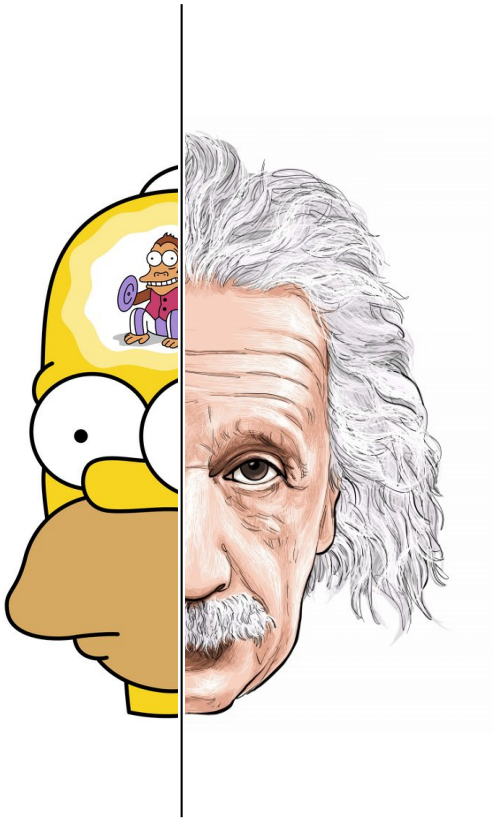


Dehaene et al.



Perceptual boundaries to build hypotheses

Physics on the skin → Reported sensation

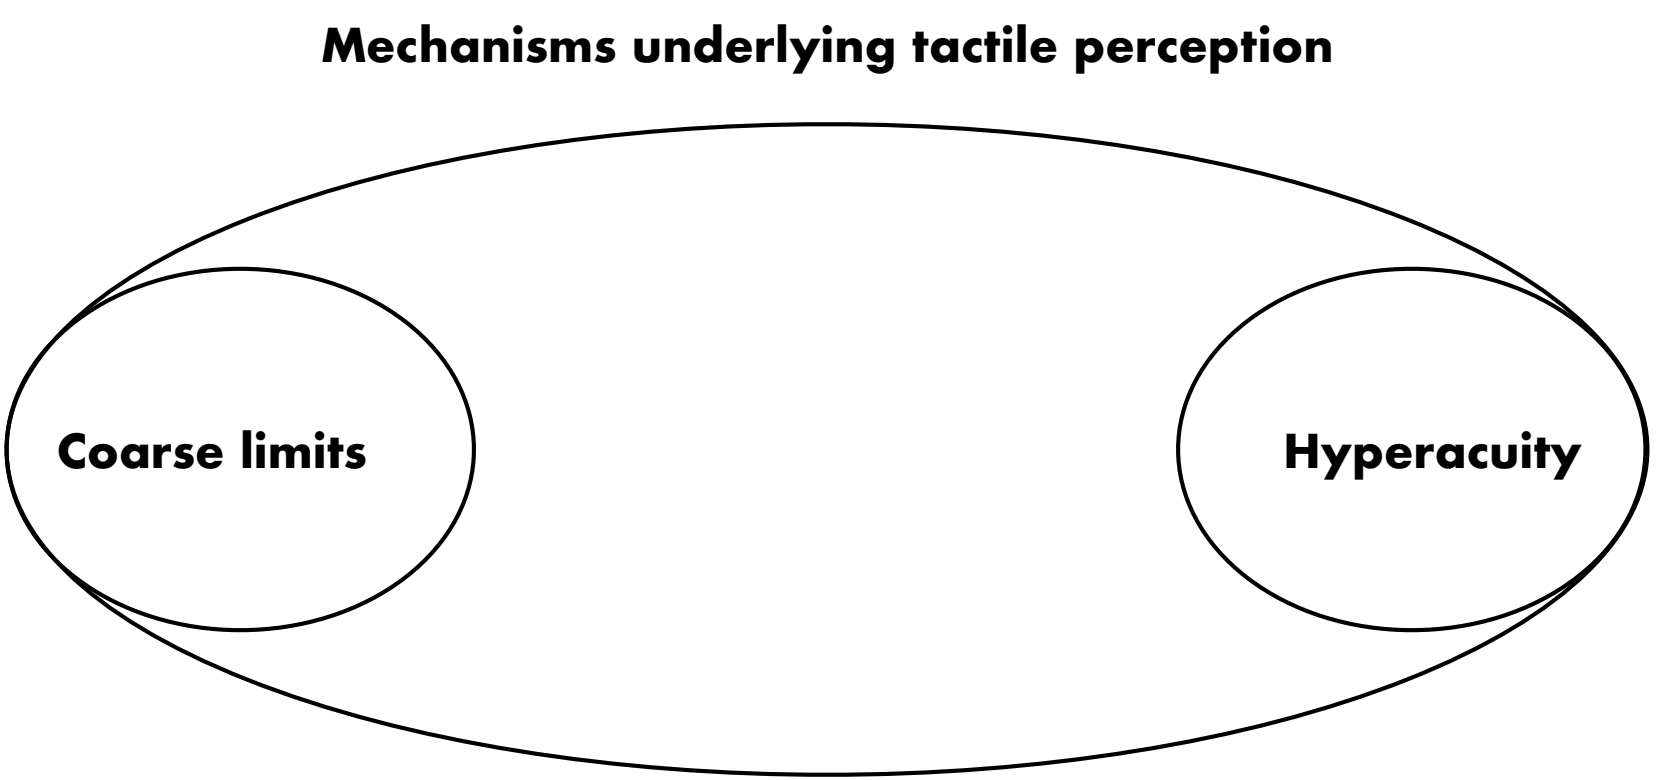


Coarse limits **Hyperacuity**

Fradin J, Dione M, Mouraux A, Ackerley R, Gueorguiev D. Boundaries of tactile acuity when exploring surfaces. Surface Topography: Metrology and Properties. 2025

Perceptual boundaries to build hypotheses

Physics on the skin → Reported sensation

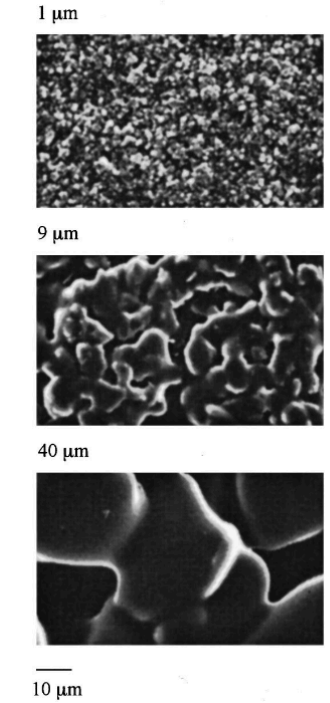


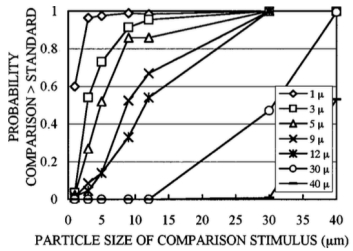
Outline

- What psychophysics can do, and what it can't
- Testing the boundaries of tactile acuity
- Expert plucking of guitar strings
- Feeling isoenergetic ultrasonic signals
- When perception is multisensory

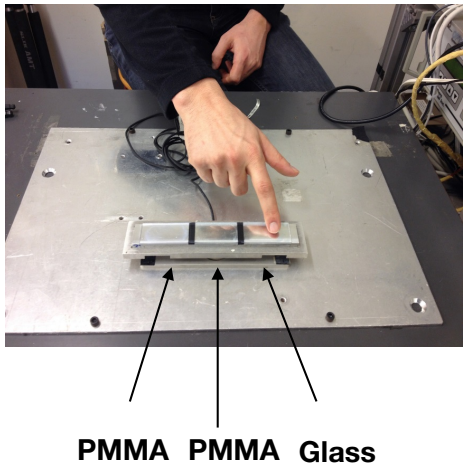
Feeling the microscopic world

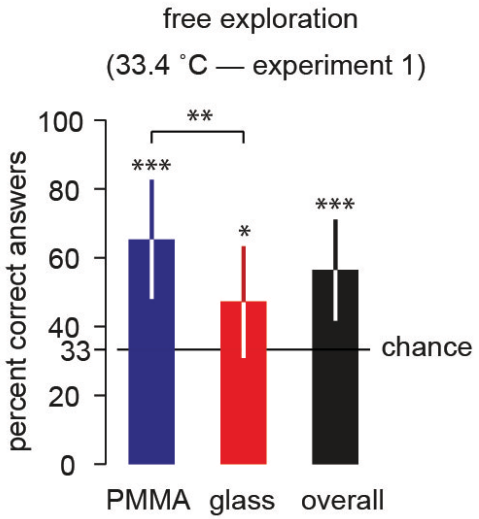
Miyaoka et al. 1999



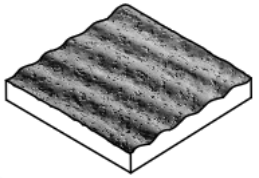


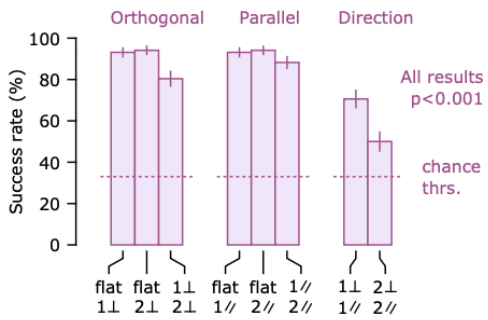
Gueorguiev et al. 2016

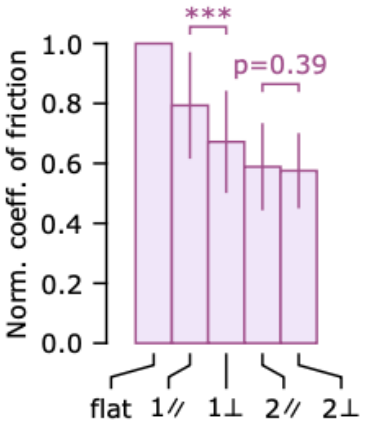




Daunizeau and Hayward

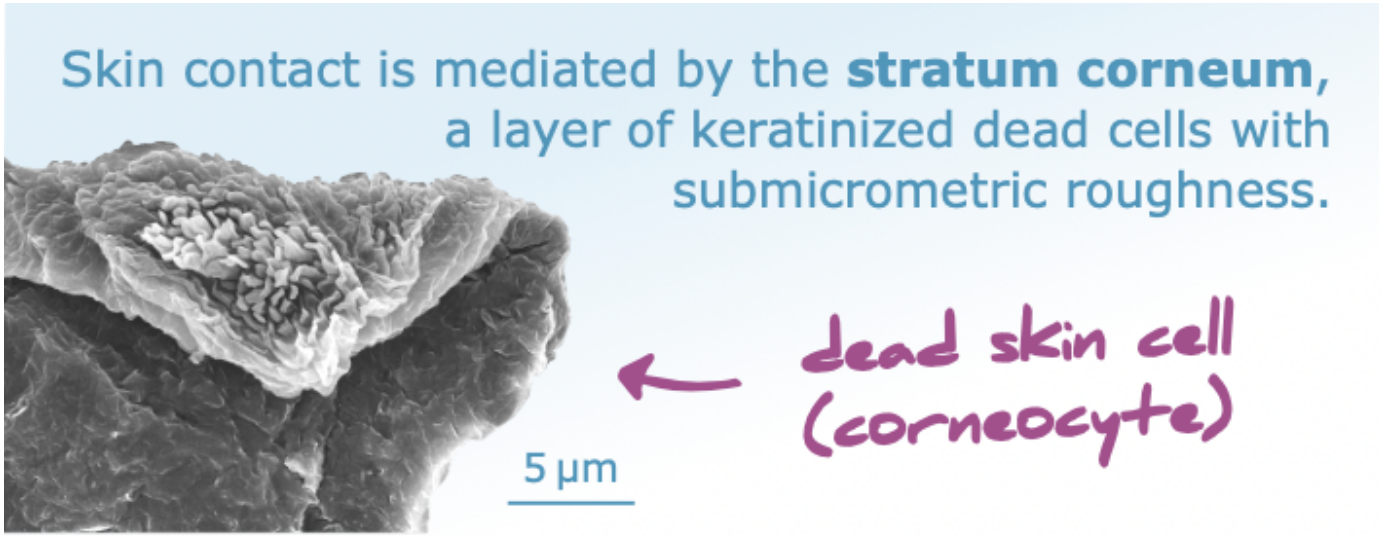


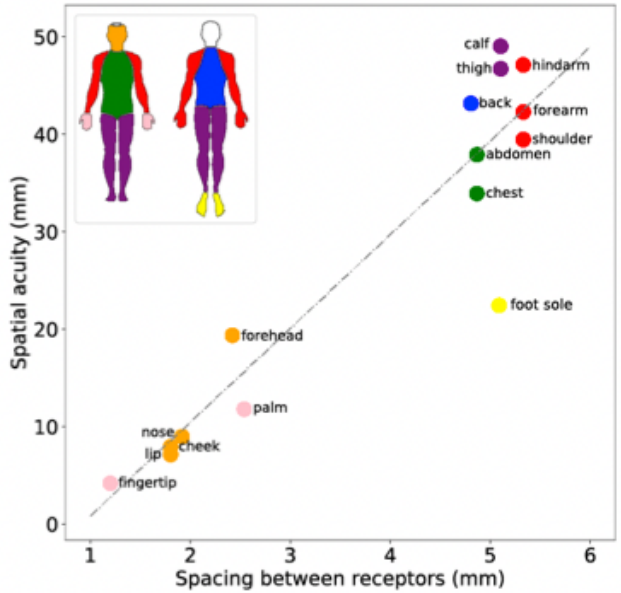




Feeling the microscopic world

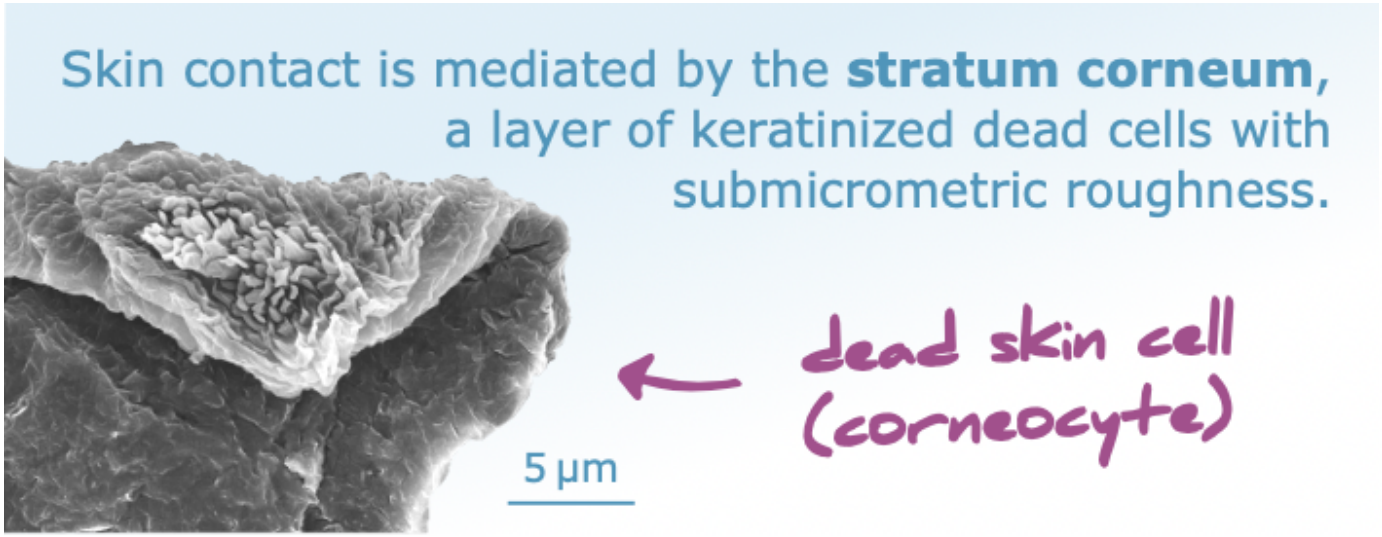
- **How is such accuracy possible considering that skin structures are order of magnitudes larger?**

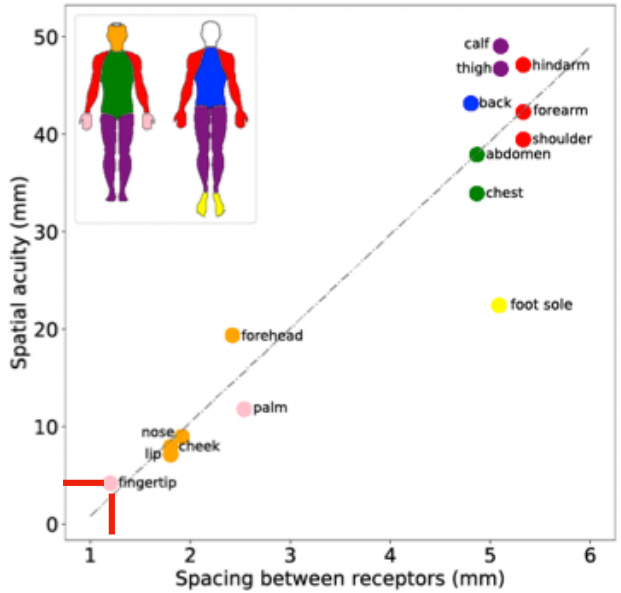




Feeling the microscopic world

- **How is such accuracy possible considering that skin structures are order of magnitudes larger?**





The potential mechanisms

- **Molecular bonding between the skin and surfaces**
- **Occurrence of distinct strain patterns on different materials and topographies**
- **Still, very puzzling**

Outline

- What psychophysics can do, and what it can't
- Testing the boundaries of tactile acuity
- Expert plucking of guitar strings
- Feeling isoenergetic ultrasonic signals
- When perception is multisensory

How to create a virtual guitar

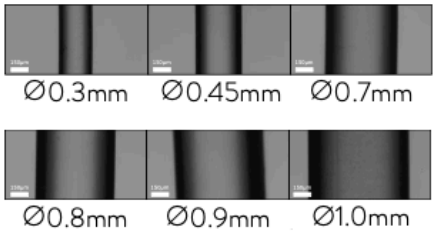
?

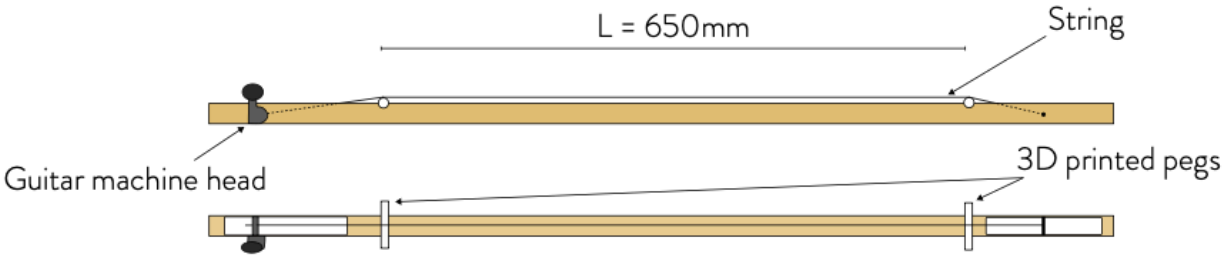
?

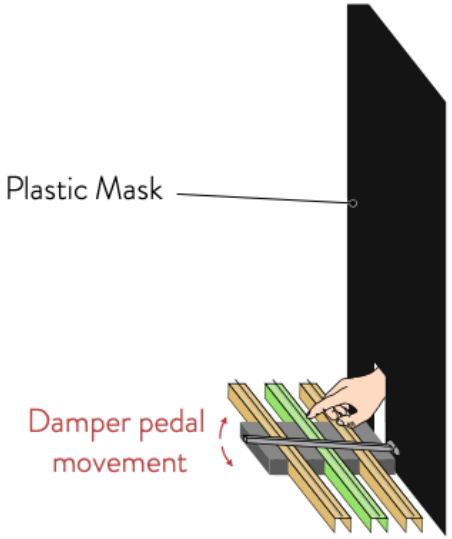
Perception of guitar strings properties

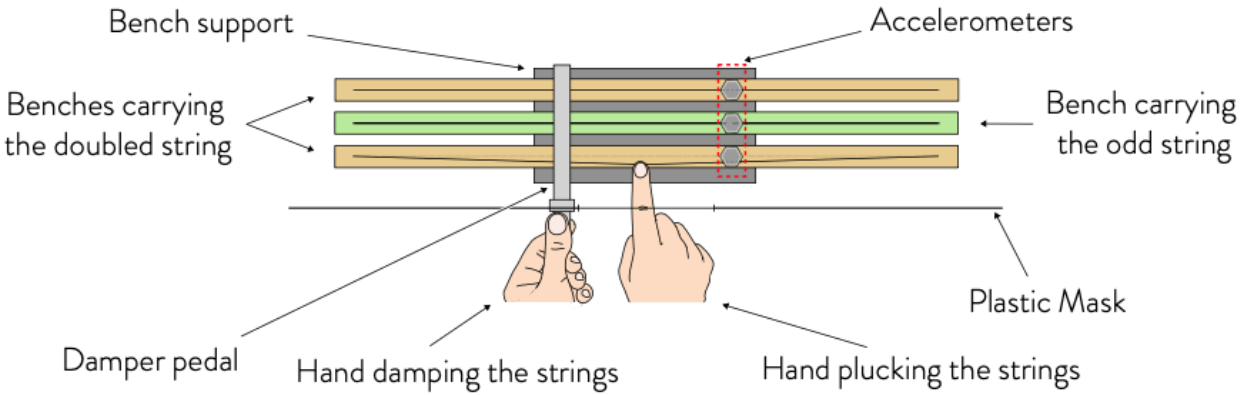
Matej Mayet

- Is haptic feedback different depending on the string?



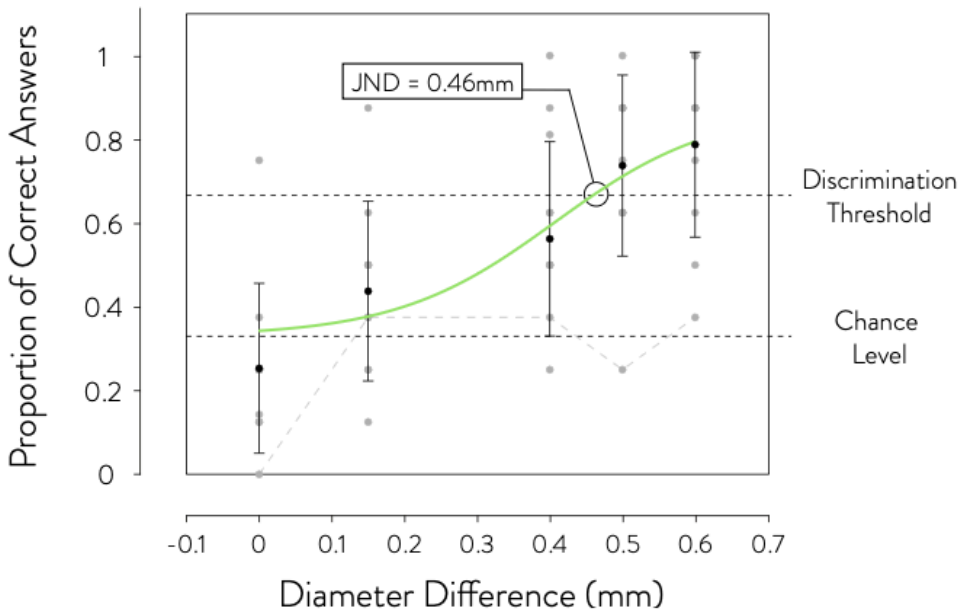




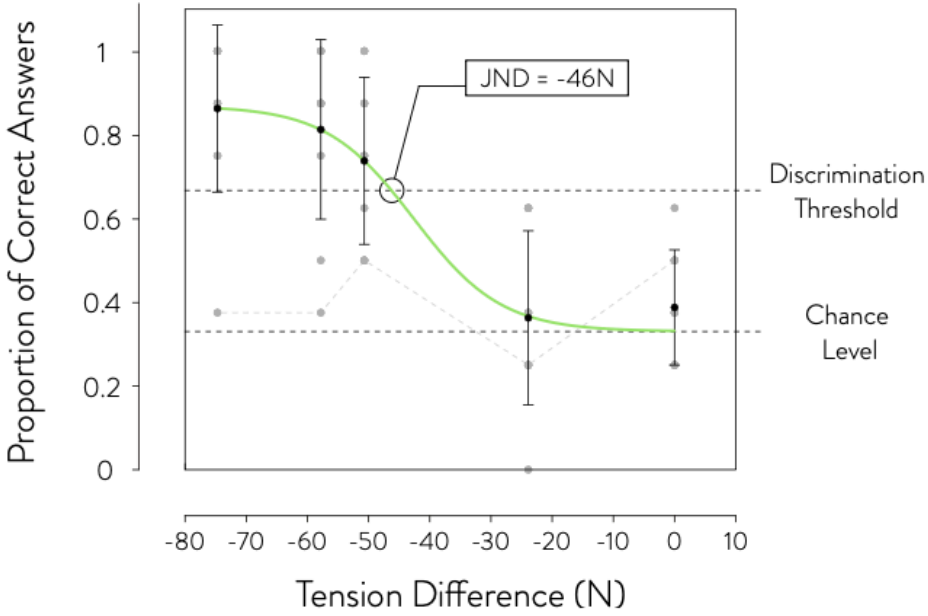


JND for string diameter and tension

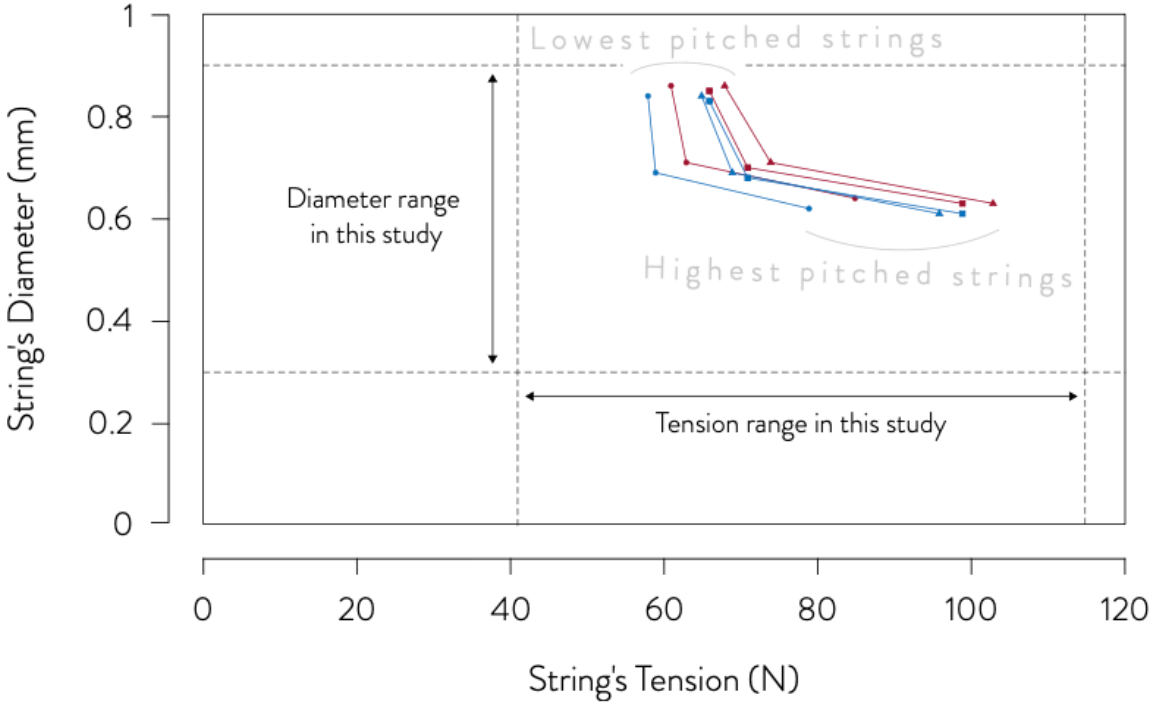
Ref. diameter = 0.3 mm

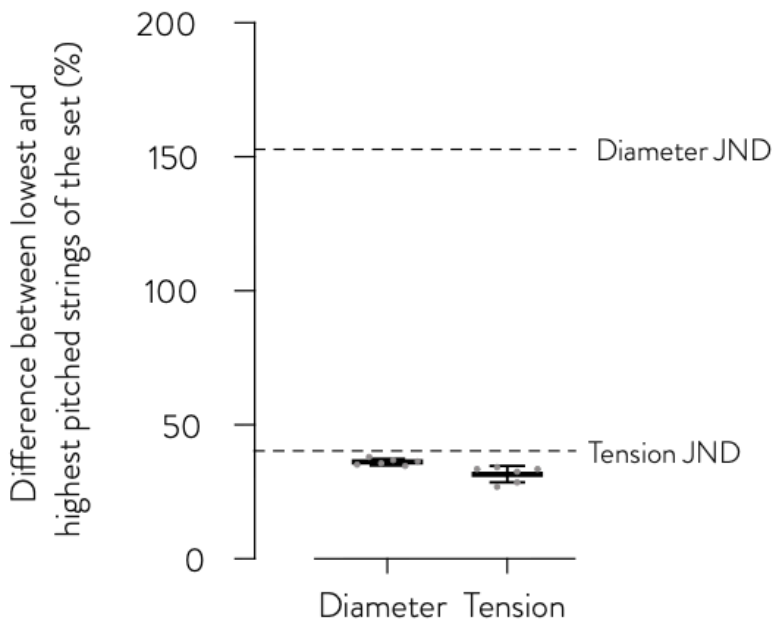


Ref tension = 115 N



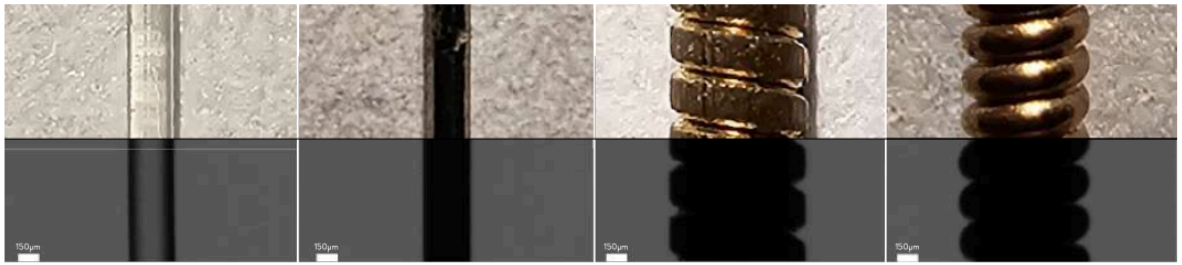
Comparison with actual guitar practice



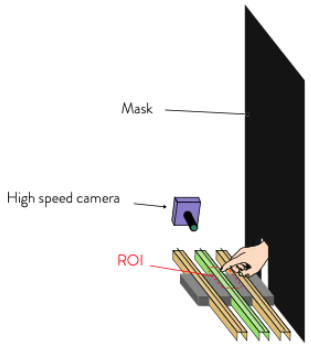


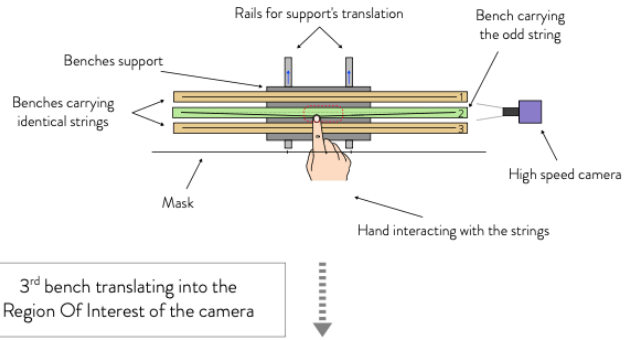
Doesn't seem that strings' diameter or tension provide differentiated haptic feedback

String's material and winding



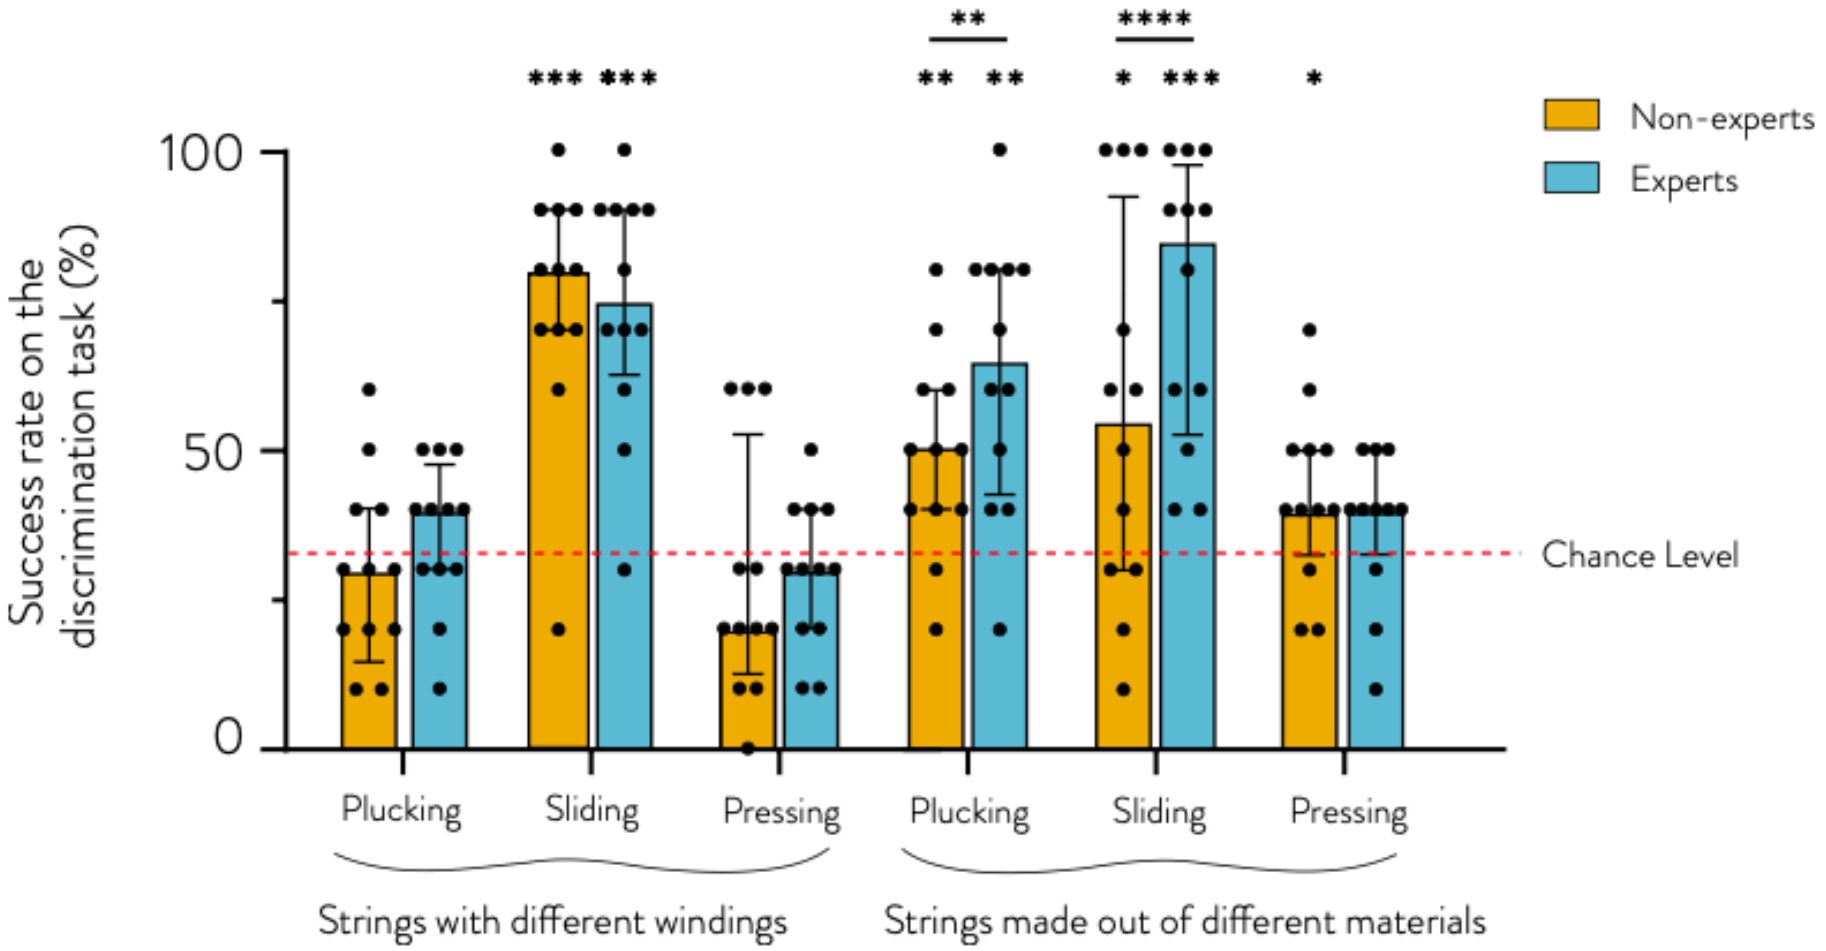
String 1 : Nylon | String 2 : Steel | String 3 : Semi-flat winding | String 4 : Round winding



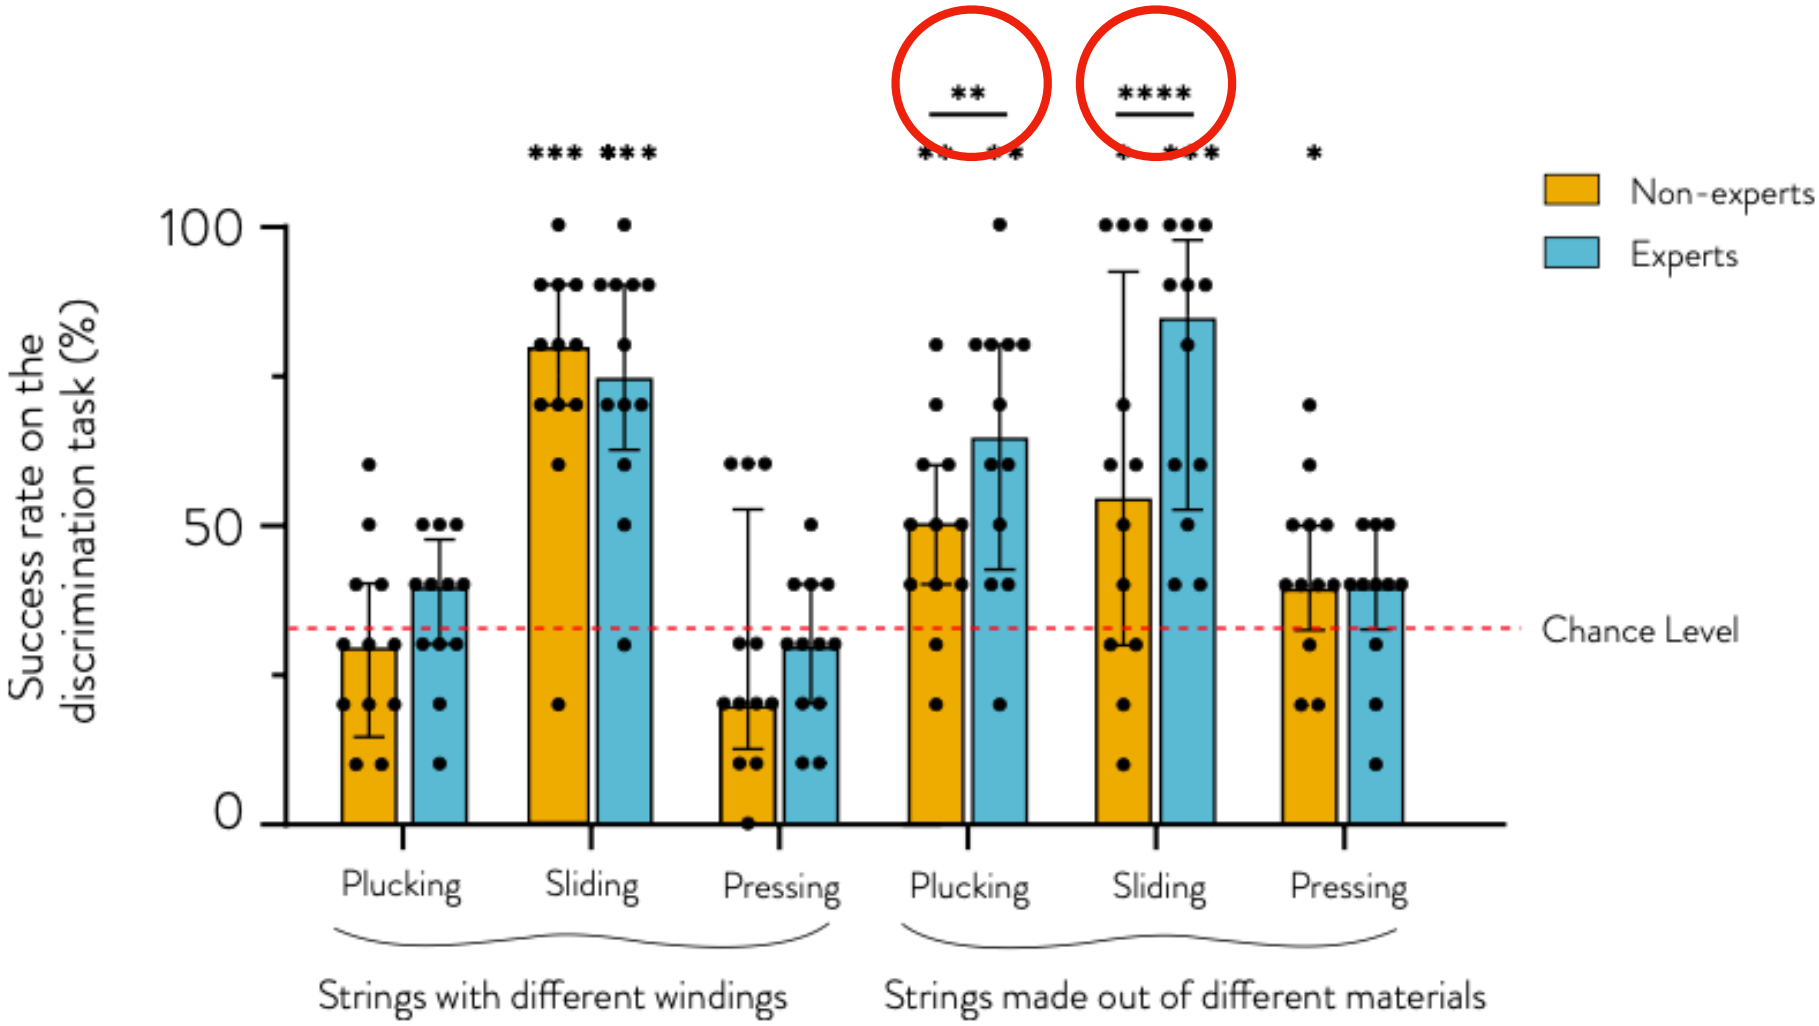


- Discrimination experiments with experts and novices

Capacity to discriminate string properties

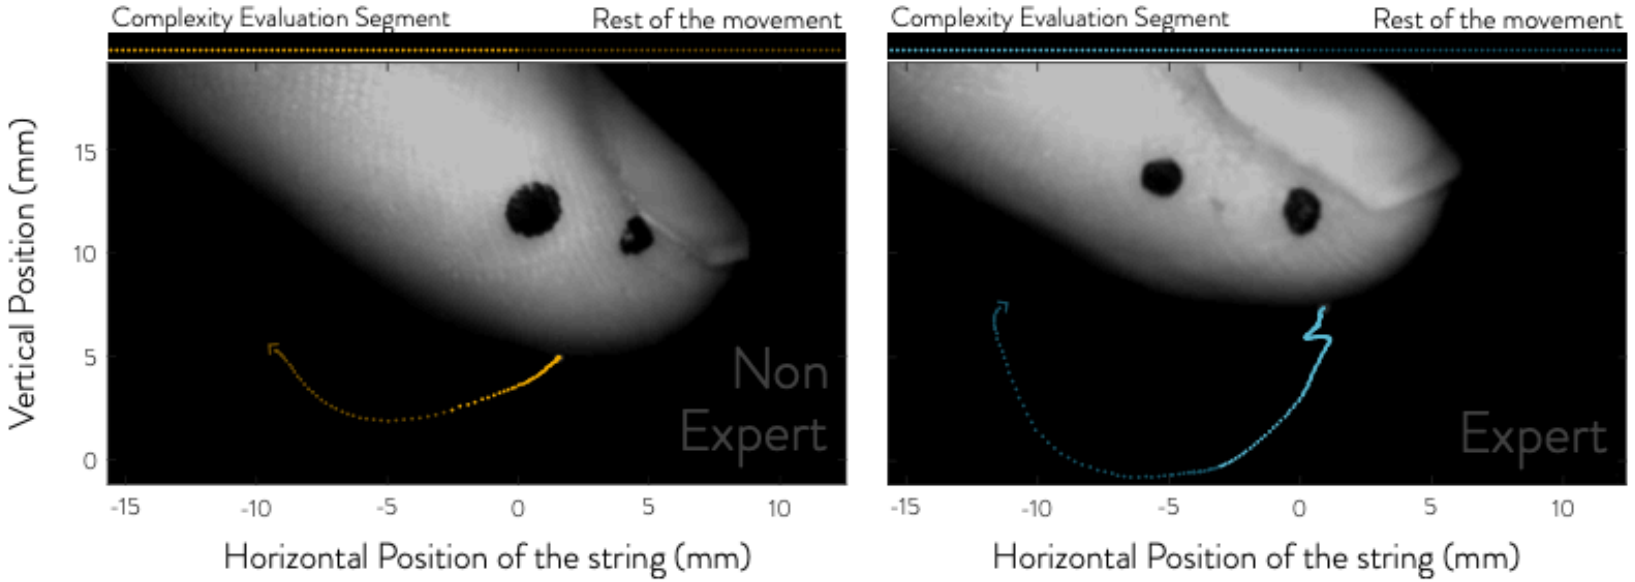


Capacity to discriminate string properties

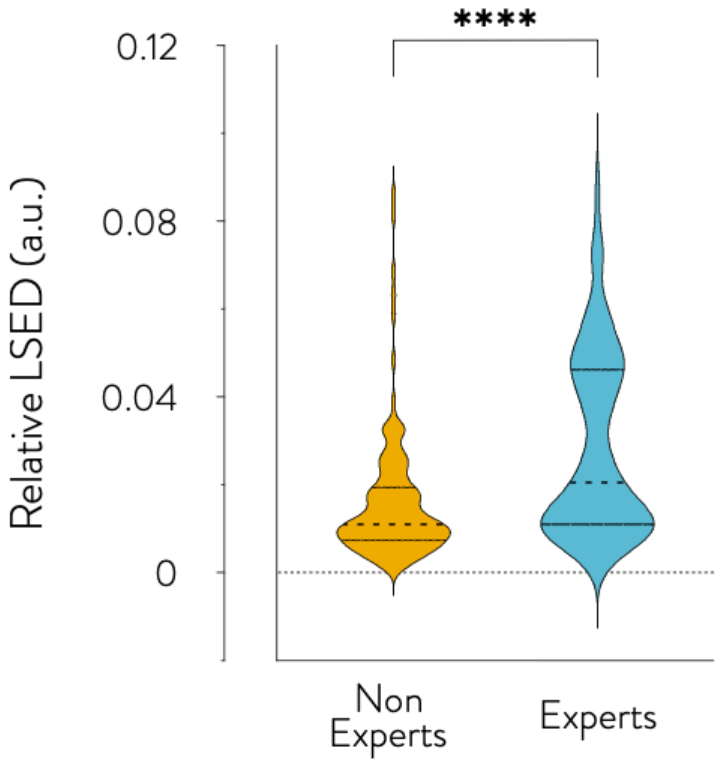


Dynamics of the contact

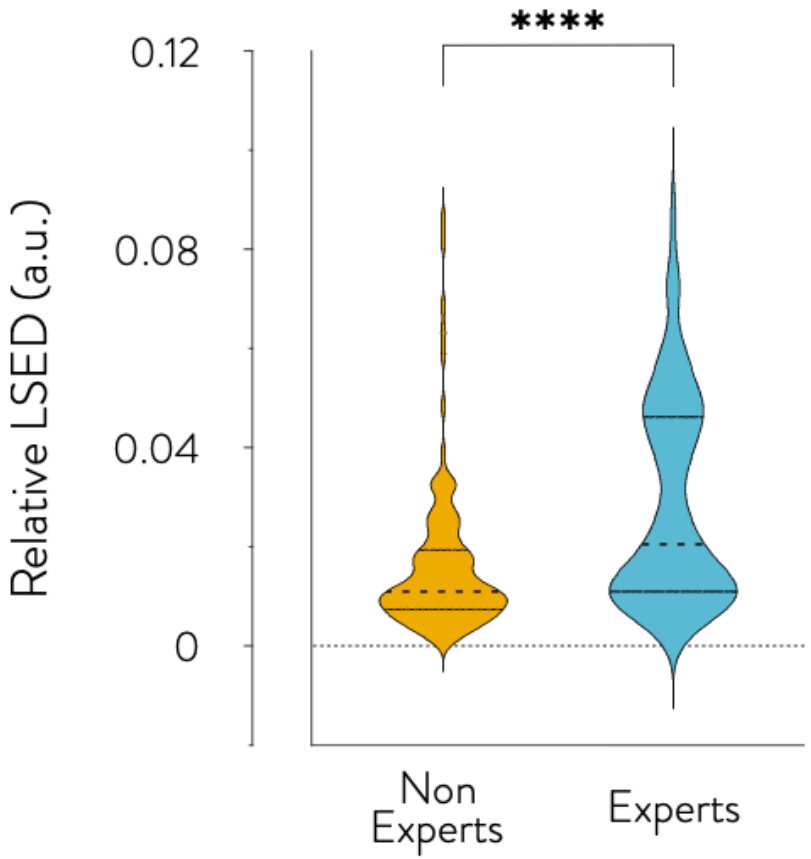
Complexity of the interaction

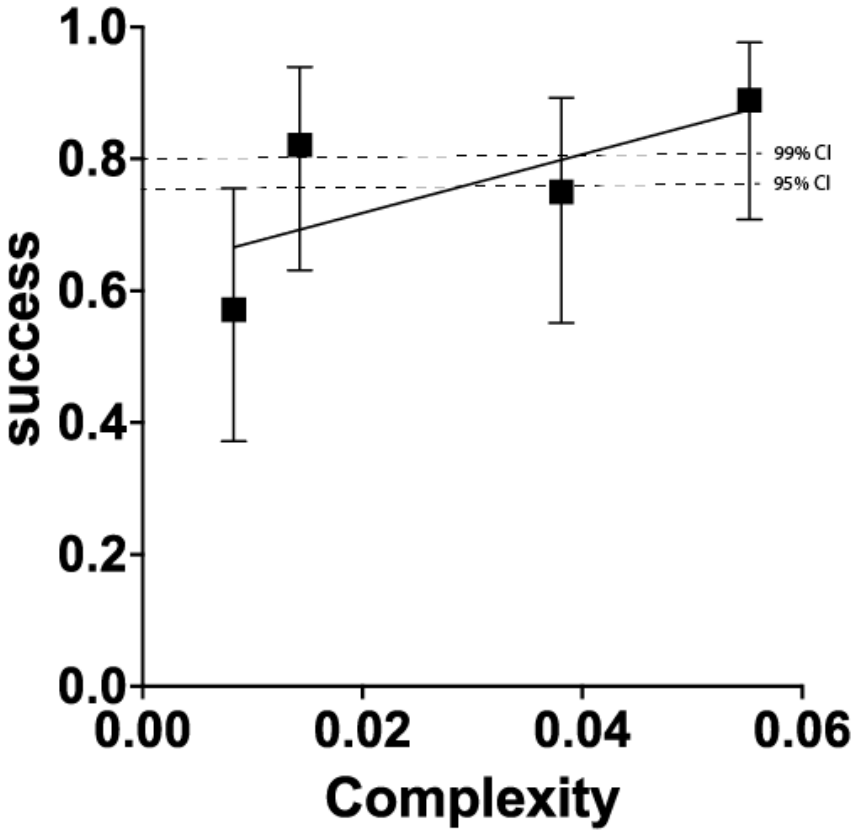


Complexity of the interaction



Complexity of the interaction





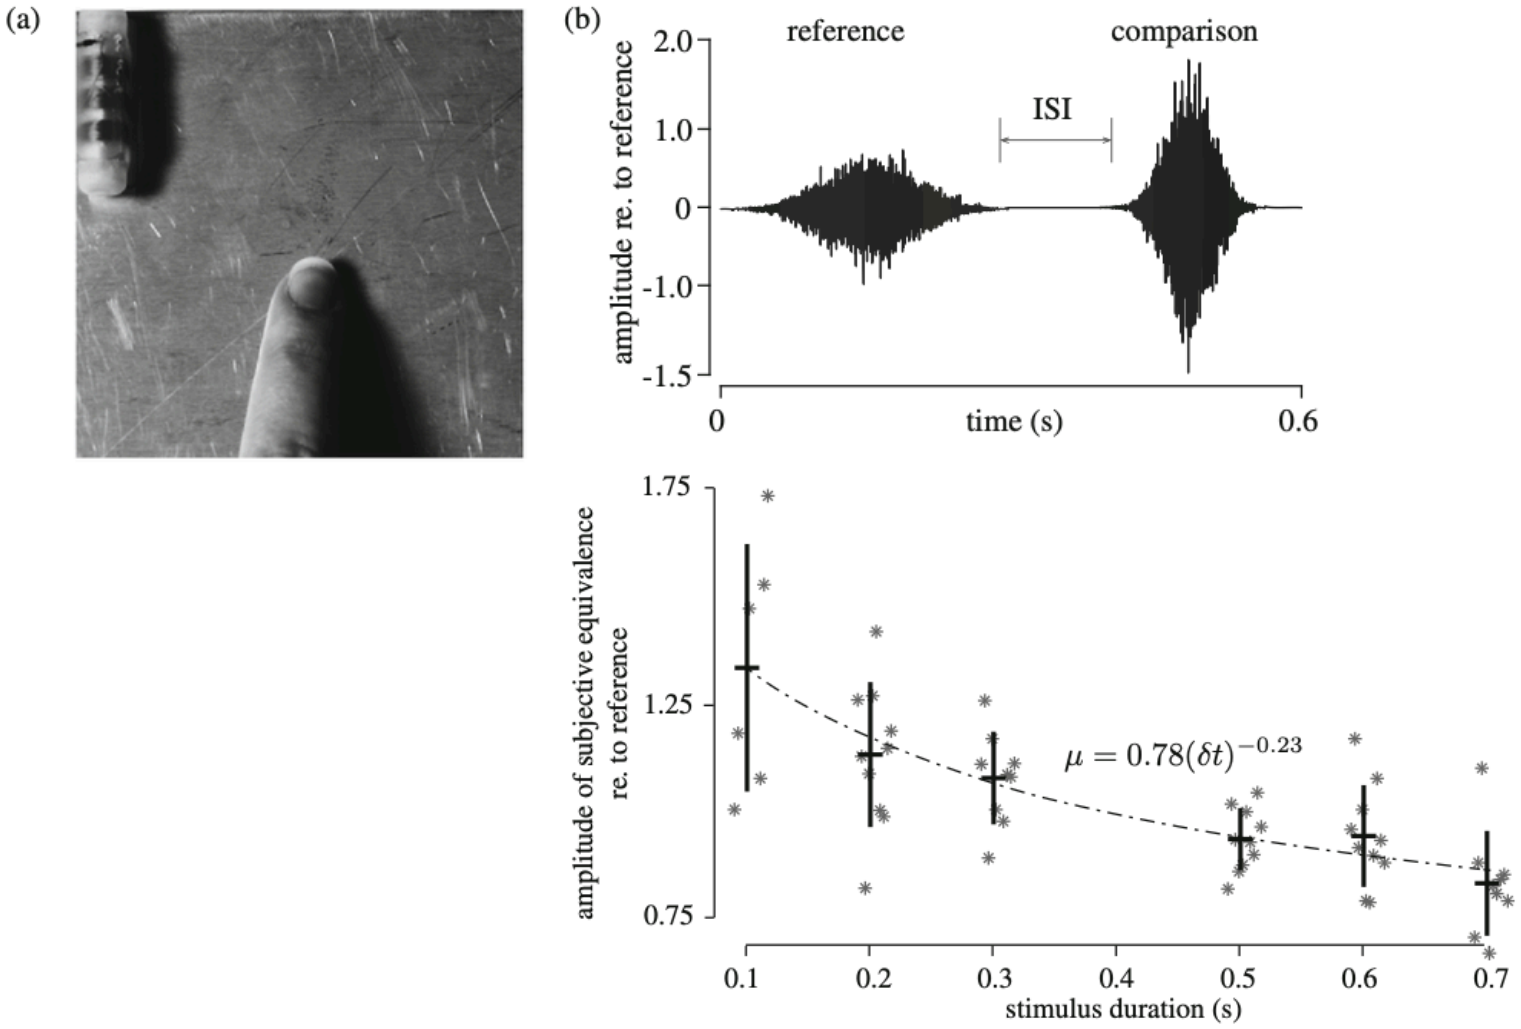
- Experts perform more complex movements than novices
- For equal expertise, success rate increases when the movement is more complex

Outline

- What psychophysics can do, and what it can't
- Testing the boundaries of tactile acuity
- Expert plucking of guitar strings
- Feeling isoenergetic ultrasonic signals
- When perception is multisensory

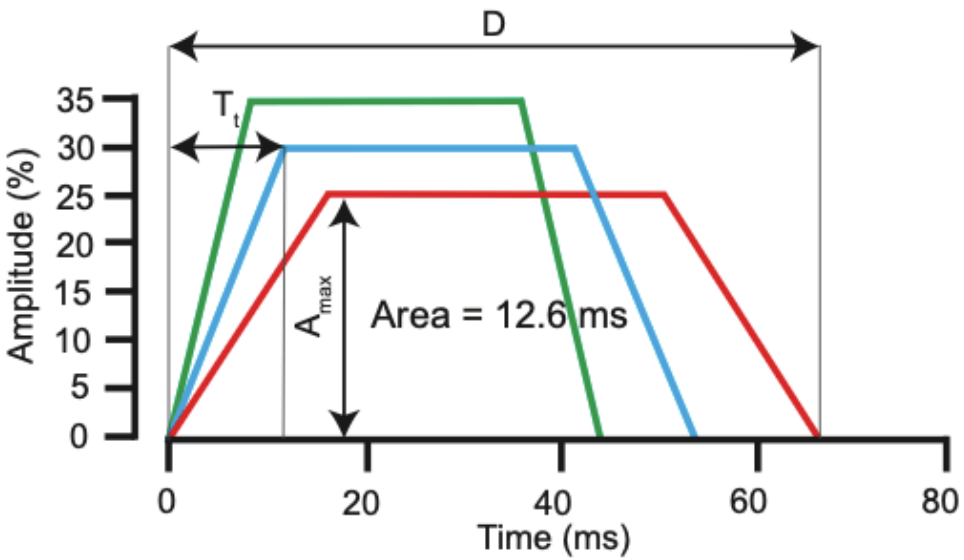
Feeling isoenergetic signals

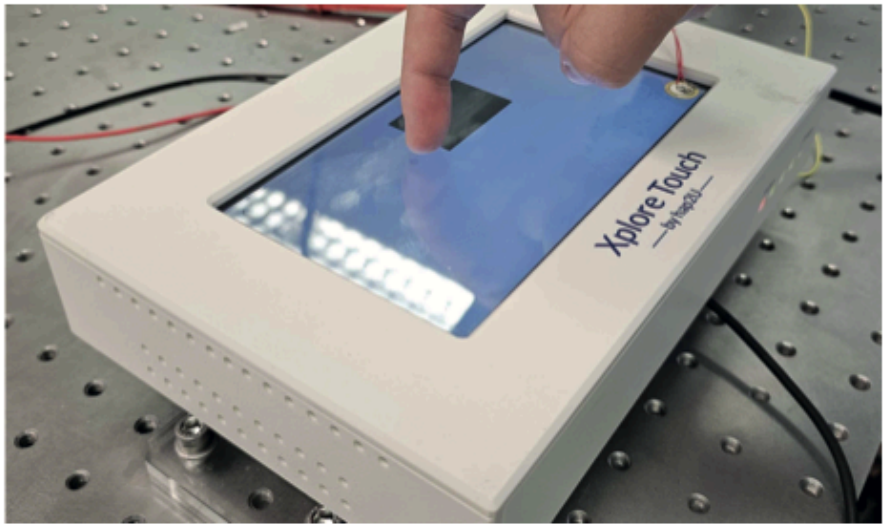
The duration of a vibration can compensate its strength (Bochereau et al.)



Feeling isoenergetic signals

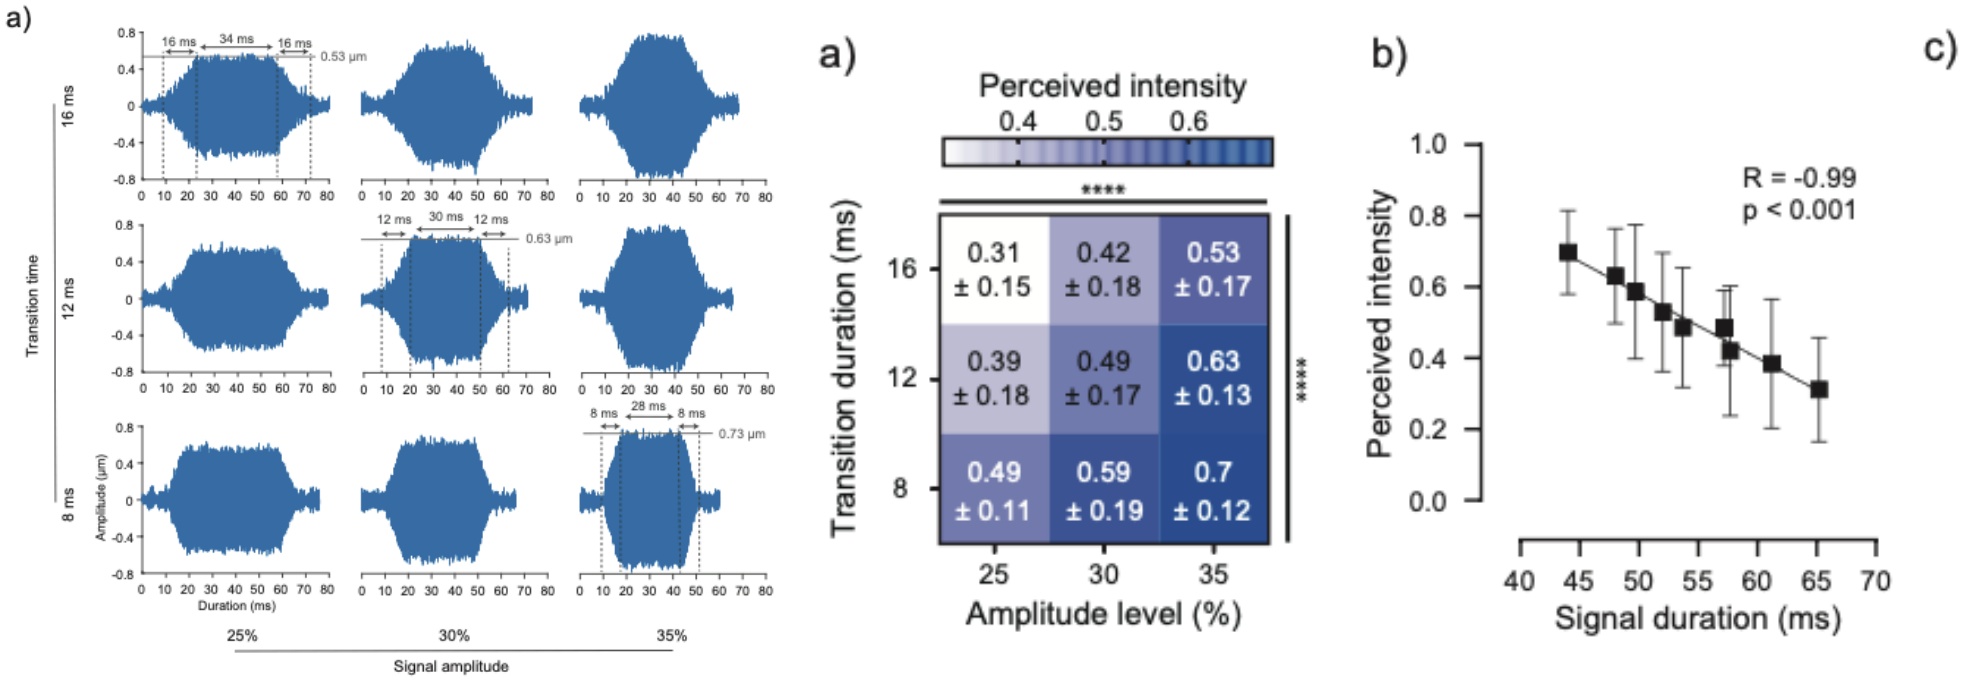
Is the same true for ultrasonic pulse that reduce skin-surface friction?





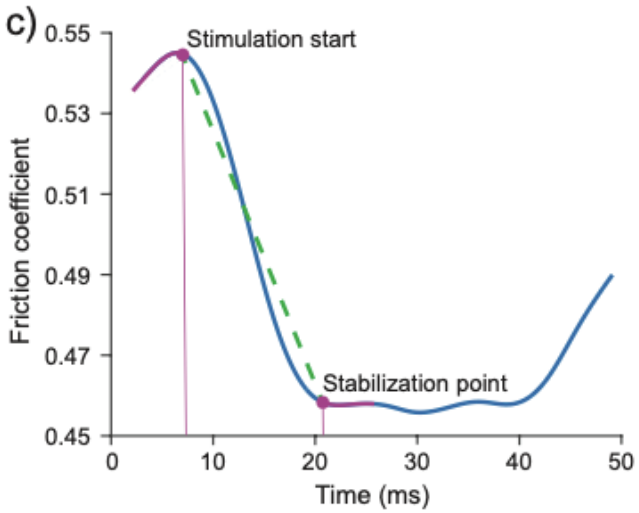
Feeling isoenergetic signals

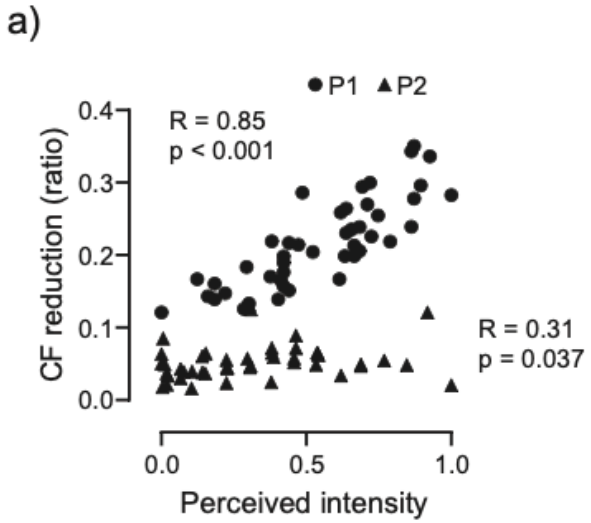
Both the friction reduction and sharpness play a role, but no compensation occurs when the stimulus length is increased

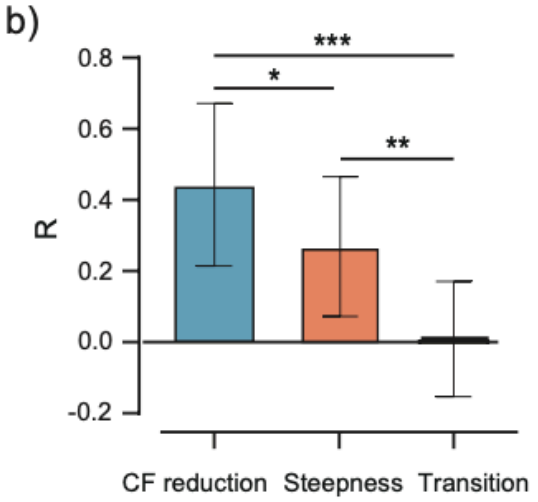


Feeling isoenergetic signals

Both the friction reduction and sharpness play a role, but no compensation occurs when the stimulus length is increased

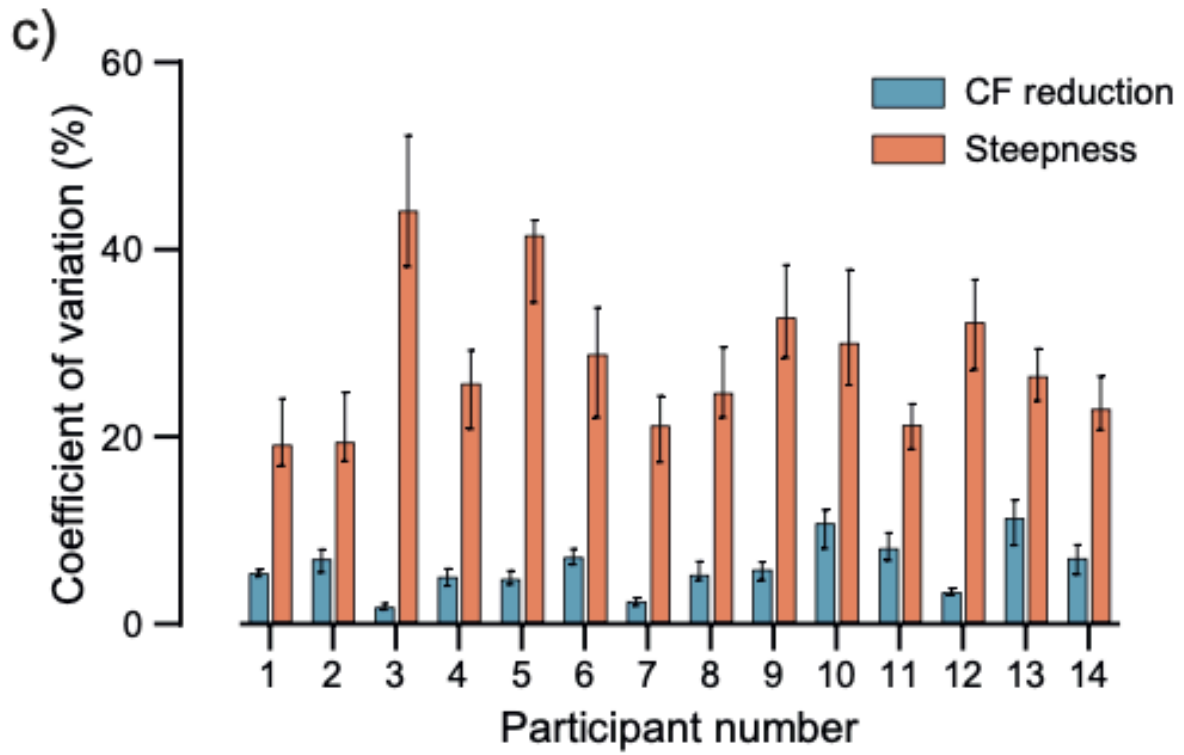






- Computing the reduction of dynamic friction coefficient and the slope during the change
- Correlation with the the perceived intensity in each trial

Feeling isoenergetic signals



- The steepness of the change varied tremendously across the five strokes of a trial
- While the change of the coefficient of dynamic friction remained fairly stable
